

How Do I Enable the Embedded Scanner on my Laptop?

You can enable the embedded fingerprint scanner by following these steps:

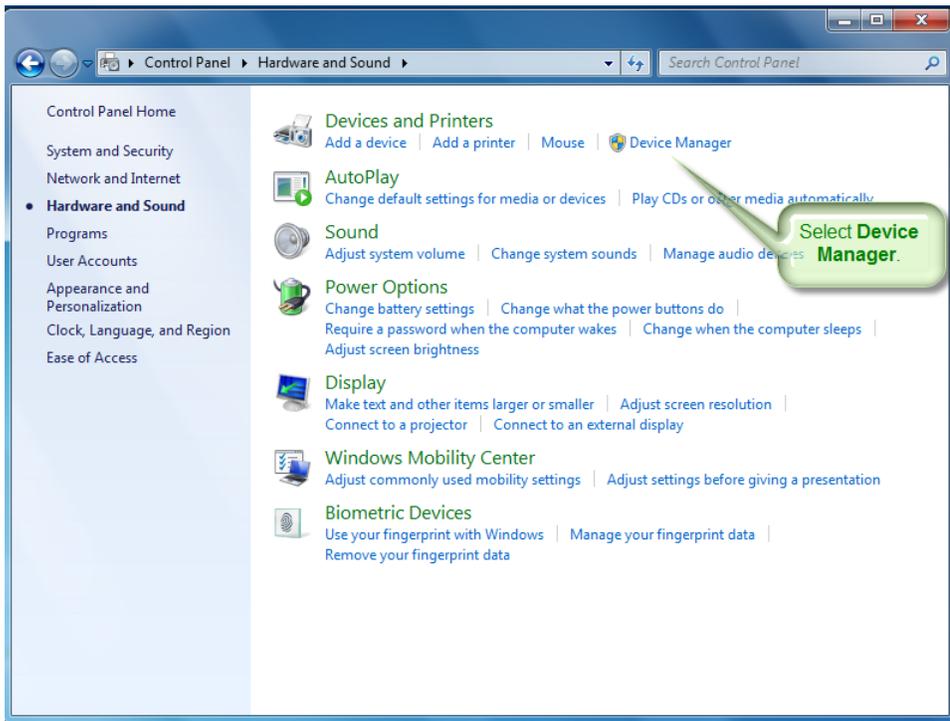

- 1) Press the Windows key to display the Start Menu. 
- 2) Select the **Control Panel** option from the column on the right to display the Control Panel in Category View format.

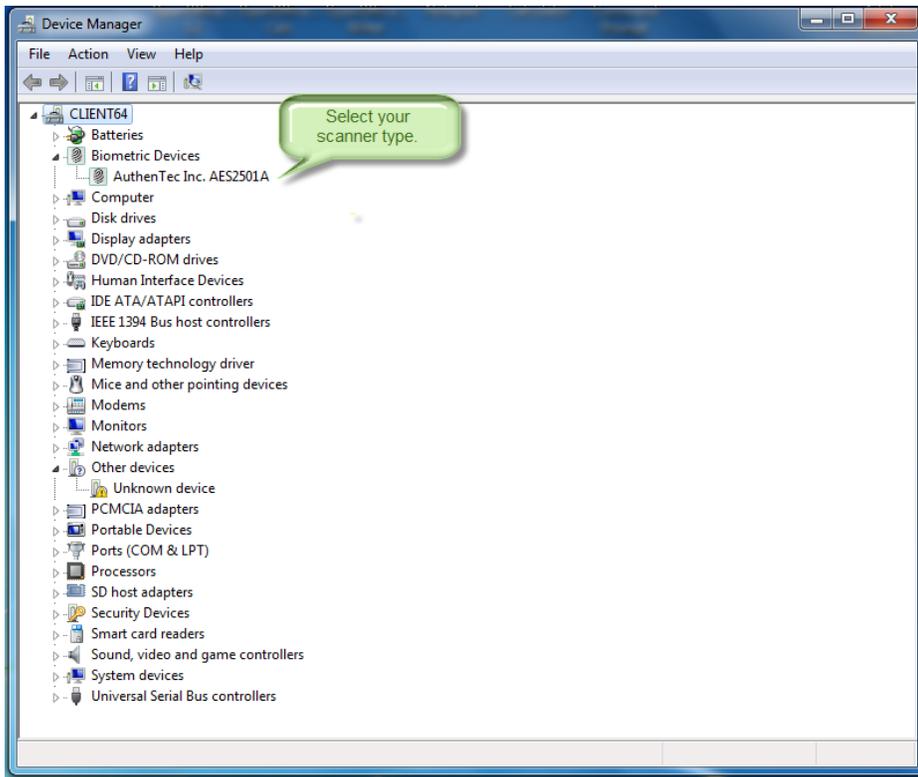

3) Click the **Hardware and Sound** option.

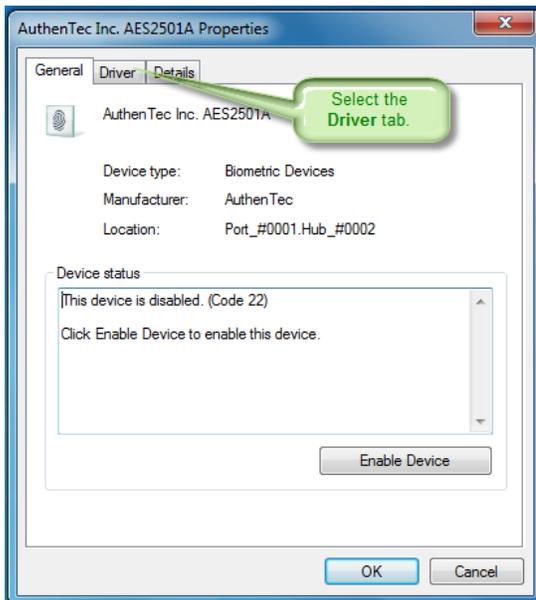

4) In the Devices and Printers section of the Hardware and Sound panel, select the **Device Manager** option.

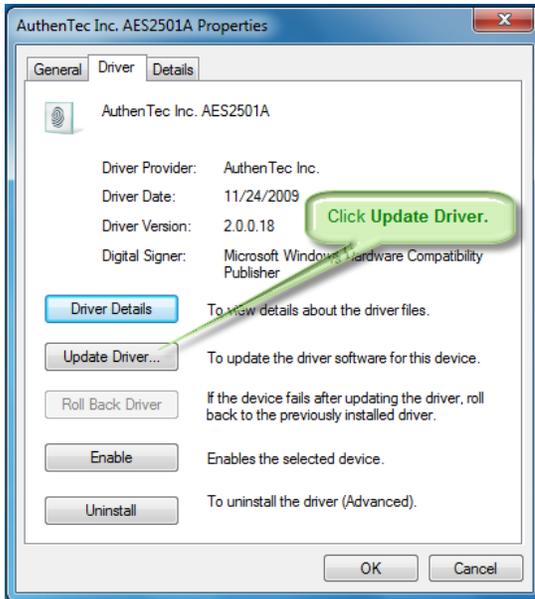

- 5) In the Biometric Devices section, select your scanner to display its properties.

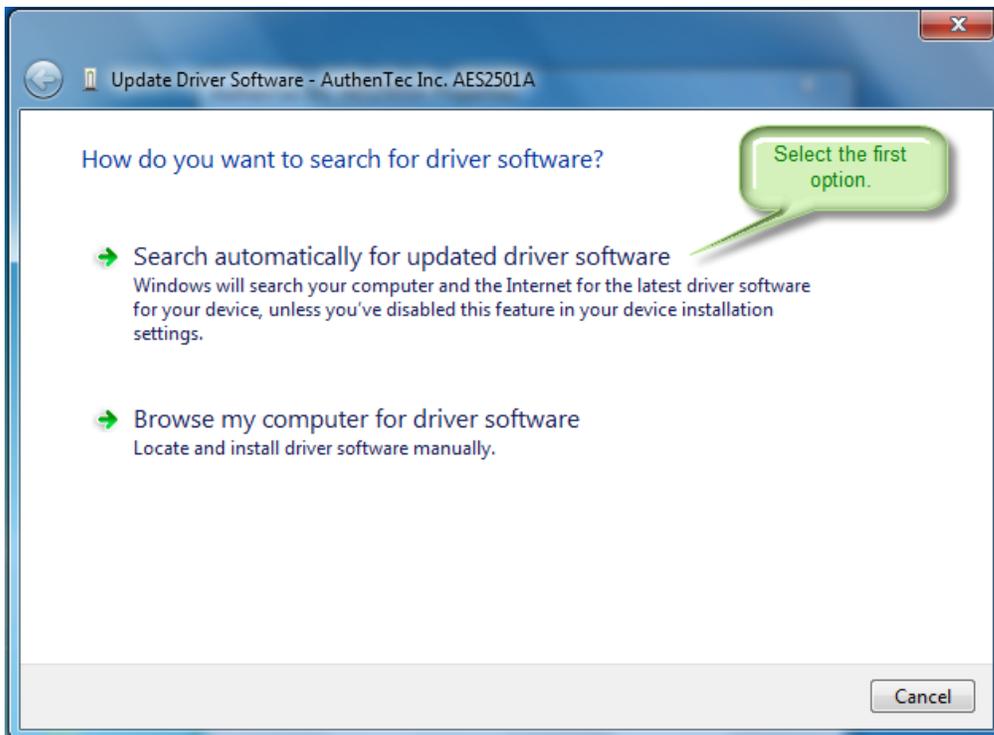

- 6) To check if you have the latest drivers available for your scanner type, select the **Driver** tab on the scanner properties dialog.

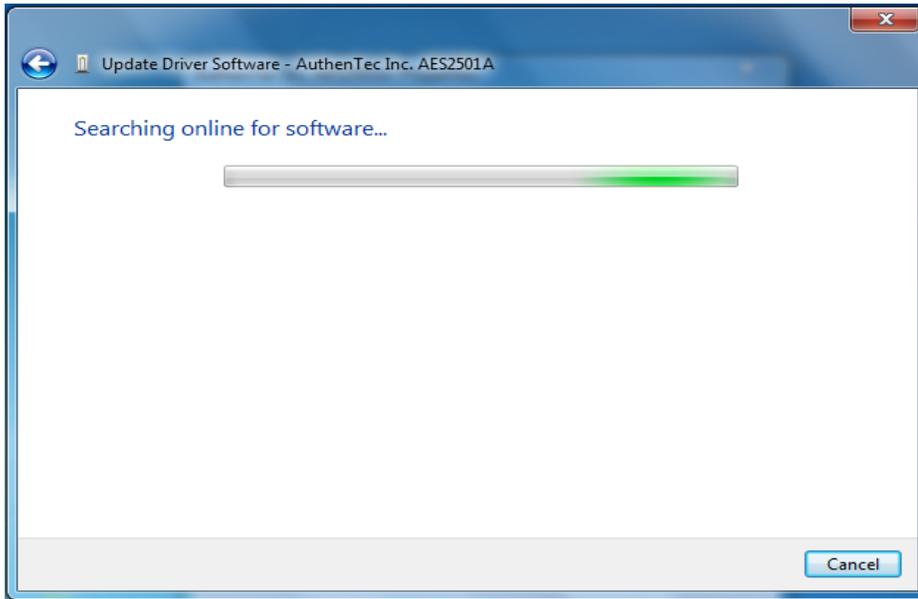

- 7) On the Driver tab, click the **Update Driver** button to display the Update Driver Software dialog.

- 8) Select the first option so that Windows will automatically search the manufacturer's website for any available driver updates.

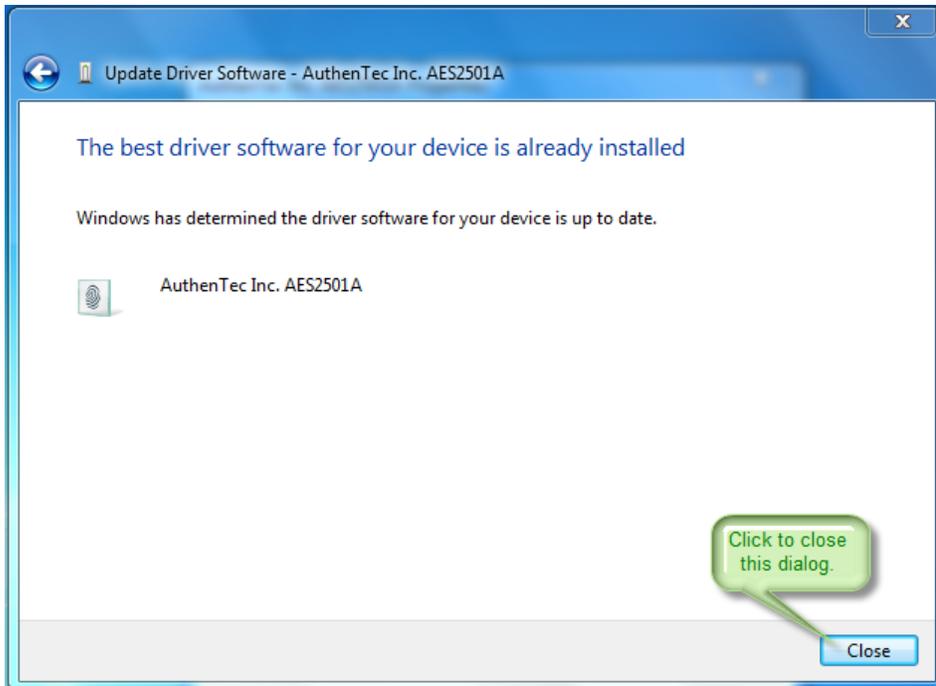

- 9) The Update Scanner Software dialog shows the progression (**Searching for Online Software**) while Windows is searching for updates.

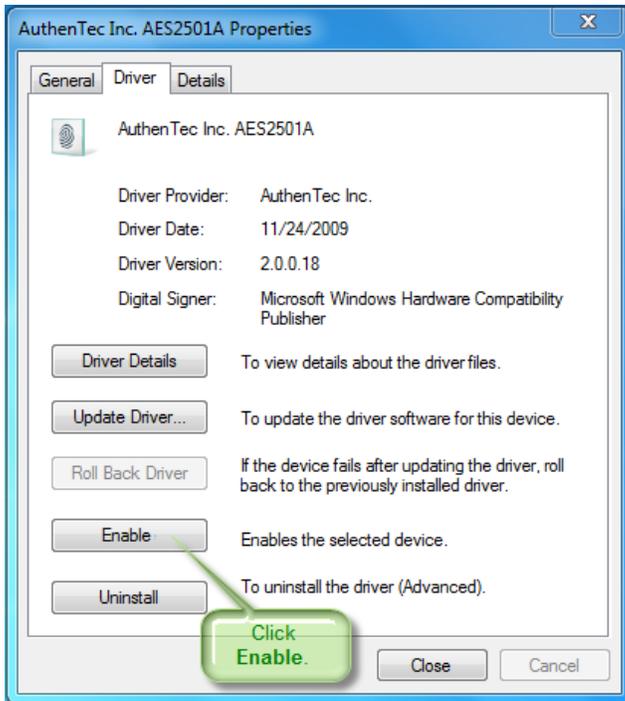

The dialog automatically displays an updated status once the search has finished and any necessary updates have been performed.

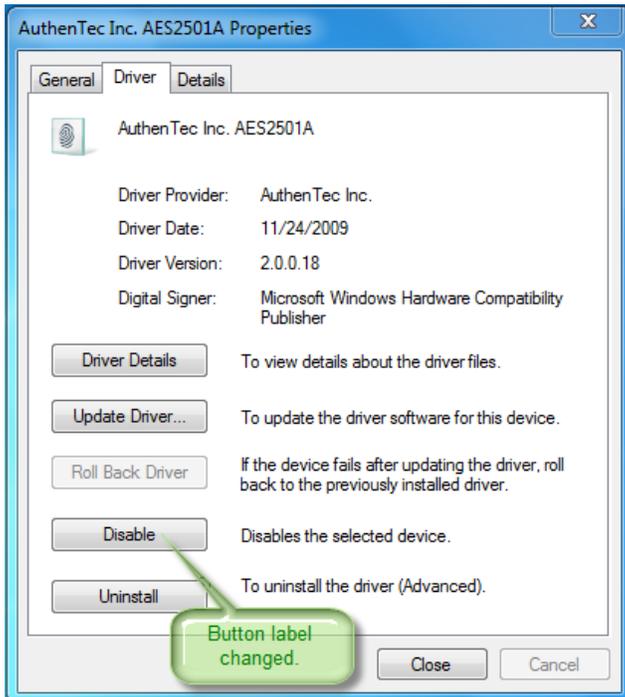

- 10) Click the **Close** button to close the dialog and return to the scanner properties dialog.

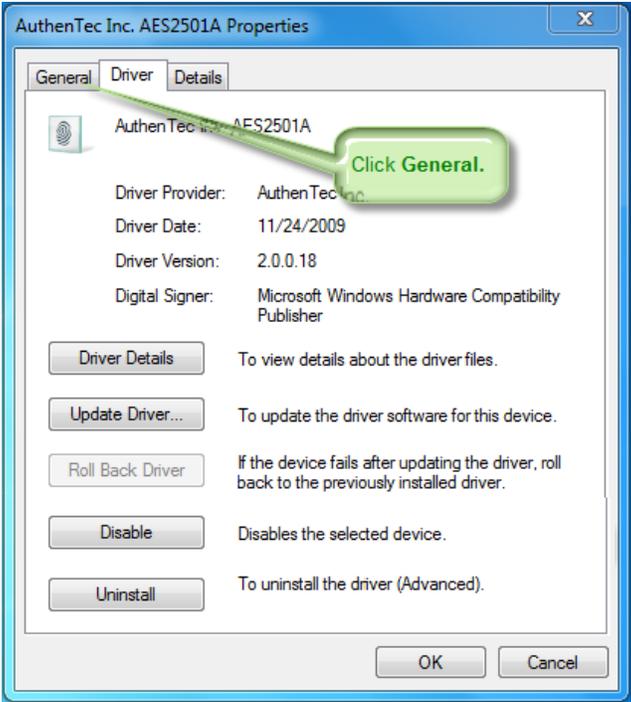

11) On scanner properties dialog, click the **Enable** button to ready the device drivers.

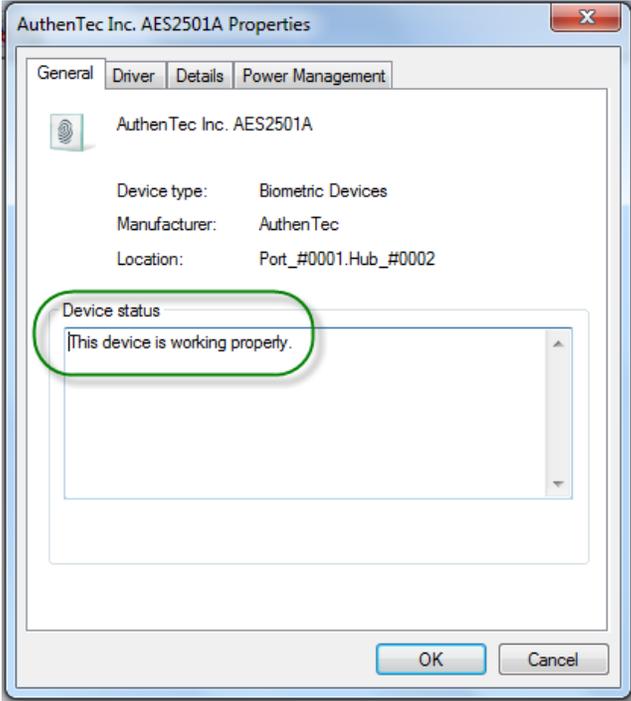

When the Enable button label changes to **Disable**, your fingerprint scanner is enabled.

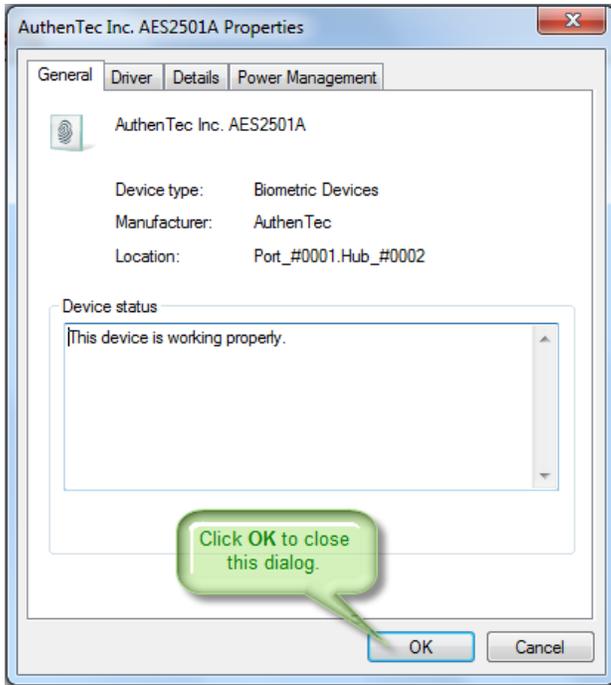

12) Select the **General** tab.

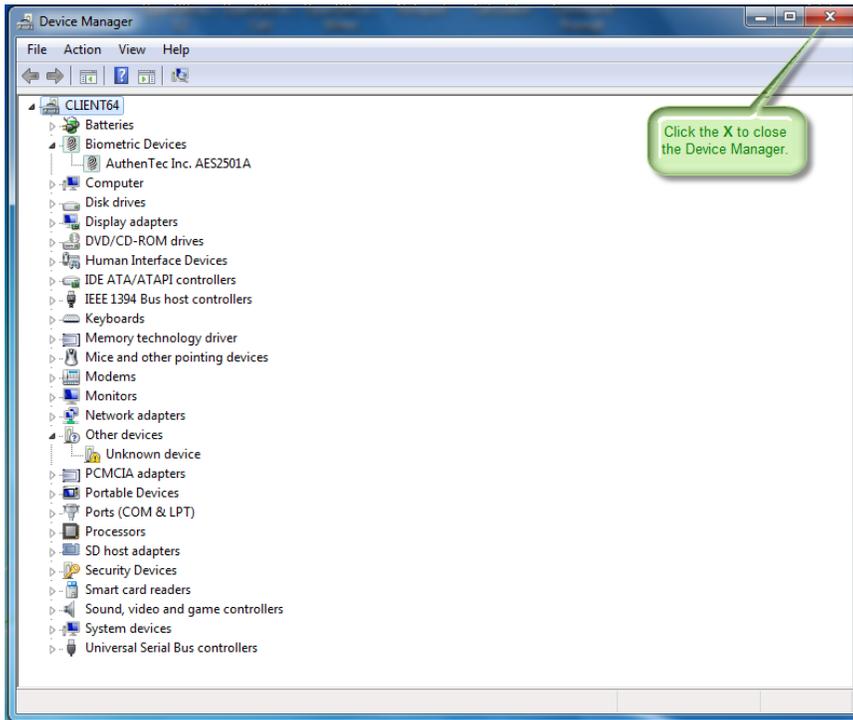

13) Check the **Device Status** box to verify that your fingerprint scanner is working.

- 14) Close the scanner properties dialog to return to the Device Manager window.

- 15) Close the Device Manager.

Now that you've enabled the fingerprint scanner on your laptop, you will need to install **ValidateMe!**. For the how-to, see the section, **How do I install ValidateMe! on my computer?**, later in this chapter.
